LEARNING DIARY, SOFTWARE DEVELOPMENT MODULE

LEARNING DIARY

Most of the stuff on this course is quite familiar to me. I've developed a couple of android apps, one of which as part of my bachelor's thesis and couple for my hobbies. Mostly I've done the development using Android studio and VSCode and used GitHub for version control.

I decided to use my bachelor's thesis app for this, as it already includes all the required components for the course project: buttons, multiple views, and an information display. I also confirmed from Erno Vanhala that there is no problem with using the app, as I didn't use the app itself as part of my thesis, rather I wrote my thesis about developing the app.

Like I said, most of the stuff was familiar to me, and thus I felt there wasn't that much more for me to learn, so I picked an old project to conserve my time for other courses. I must say the teaching videos were a bit confusing, being made on an apple computer eight years ago, for example IntentService is nowadays deprecated, but I guess otherwise they did their job fairly well.
